

Azizxon Bahodirov — Full-stack developer

Next.js, React, TypeScript, Node.js, PostgreSQL.

Also written as Azizkhon Bakhodyrov and Азизхон Баходыров.

UNTRA.DEV · Tashkent · Available for freelance work

Three years in production, building admin panels that run real orders and real couriers, plus the APIs and databases behind client products. My strongest layer is the product: interfaces, business logic, integrations, APIs and PostgreSQL. Complex infrastructure I build together with a dedicated specialist.

- **3** years in production, 1.5 of them at Noor
- **359/368** merchant-panel commits at Noor are mine

HOW I WORK

Process

1. **Understand** — I ask about the actual goal, the users, and the constraints before proposing anything, not the other way around.
2. **Plan** — Scope gets broken into clear steps and packages up front, so there are no surprises mid-project on either side.
3. **Build** — Real production patterns: typed, tested where it matters, structured to be handed off or extended later, not thrown together to just work once.
4. **Review** — I test against edge cases and real data before delivery, not after you find them.
5. **Deliver** — A walkthrough of what was built, plus documentation if the project needs a handoff.

SELECTED WORK

Noor — Delivery Service · July 2024 — November 2025 (1.5 years) · 359/368 commits — merchant panel

Merchant admin panel built almost entirely alone. Also principal architect of the company's largest internal system (cpanel) — courier ops, live GPS tracking, fleet/credit management.

BUCHET.UZ · Website & admin support

Ongoing work across the site and admin panel, plus one feature designed and built solo from scratch: a full role-based access control system.

Barber Booking · Shipped — full-stack

A Telegram booking bot for a solo barber: clients pick a service and a free slot, he confirms with one tap, clients cancel themselves. Plus a business-card landing page with reviews pulled from a Telegram group, and an admin panel he runs himself. Next.js, PostgreSQL, Telegram API.

Telegram Store (demo) · Full-stack

A demo store that lives inside Telegram: catalog, cart, checkout, an owner panel with orders, stock and revenue, and AI import of products from a Telegram channel.

tg-notion-sync · Open source — Node.js

A Node.js service that reads bank notifications from Telegram over MTPROTO and writes structured records to Notion.

Vocabulary · Open source

A spaced-repetition study app with two parallel SM-2 tracks, built with Claude Code under my direction and review — public on GitHub.

Stack: Next.js · React · TypeScript · Node.js · PostgreSQL · Prisma · Redux Toolkit · AG-Grid Enterprise · Socket.IO · Firebase · Telegram API

Learning: Go
